

a) Derive the maximum likelihood estimator for  $X$ .

(additive white Gaussian channel)

$$y[n] = x[n] \otimes h[n] + w[n] = \sum_{k=-\infty}^{+\infty} x[k] h[n-k] + w[n]$$

(channel equation)

$$\begin{bmatrix} y[0] \\ y[1] \\ y[2] \\ \vdots \\ y[256] \end{bmatrix} = \begin{bmatrix} h[0] & 0 & 0 & \dots & 0 \\ h[1] & h[0] & 0 & \dots & 0 \\ h[2] & h[1] & h[0] & \dots & 0 \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ h[256] & h[255] & h[254] & \dots & h[0] \end{bmatrix} \cdot \begin{bmatrix} x[0] \\ x[1] \\ x[2] \\ \vdots \\ x[256] \end{bmatrix} + \begin{bmatrix} w[0] \\ w[1] \\ w[2] \\ \vdots \\ w[256] \end{bmatrix}$$

$y = H \cdot x + w$

$x \sim \mathcal{N}(\mu_x, \Sigma_x) : x \sim \mathcal{N}(\mu_x, \Sigma_x)$   
 $w \sim \mathcal{N}(0, \sigma^2 I) : w \sim \mathcal{N}(0, 25 \times 10^{-4} I)$   
 $y|x \sim \mathcal{N}(Hx, \sigma^2 I)$

$$f_{y|x}(y|x) = P(Y \leq y | X=x) = P(Hx + w \leq y | X=x)$$

$$= P(w \leq y - Hx)$$

$$f_{y|x}(y|x) = f_w(y - Hx)$$

$$\frac{\partial}{\partial y} (f_{y|x}(y|x)) = \frac{\partial}{\partial y} (f_w(y - Hx))$$

$$f_{y|x}(y|x) = f_w(y - Hx) = \frac{1}{(2\pi\sigma^2)^{256/2}} e^{-\frac{1}{2\sigma^2} (y - Hx)^T (y - Hx)}$$

likelihood term

Maximum Likelihood: 
 $ML \hat{x} = \underset{x}{\operatorname{argmax}} (\log(f(y|x)))$

$$\begin{aligned} \hat{J}(x) = \log f(y|x) &= -\frac{L}{2} \log(2\pi\sigma^2) - \frac{1}{2\sigma^2} (y - Hx)^T (y - Hx) \\ &= -\frac{1}{2\sigma^2} (y^T y - y^T Hx - (Hx)^T y + (Hx)^T Hx) + \text{constant} \\ &= -\frac{1}{2\sigma^2} (y^T y - y^T Hx - x^T H^T y + x^T H^T Hx) + \text{constant} \\ &= -\frac{1}{2\sigma^2} (y^T y - 2x^T y + x^T H^T Hx) + \text{constant} \end{aligned}$$

$$\hat{J}(x) = \frac{-1}{2\sigma_w^2} (y^T y - 2x^T H^T y + x^T H^T H x) + \text{constant}$$

Al: Hasan Gullu  
26/07/2019  
Alkan

we want to minimize  $\hat{J}(x)$  term. So we'll get derivative and equals it to zero.

$$\frac{\partial \hat{J}(x)}{\partial x} = 0, \quad \frac{-1}{2\sigma_w^2} (-2H^T y + 2H^T H x) = 0$$

$$H^T H x = H^T y$$

$$\hat{x}_{\text{maximum likelihood}} = (H^T H)^{-1} H^T y$$

c) Derive the maximum a-posteriori (MAP) estimator for  $x$

$$\text{likelihood term: } f(y|x) = \frac{1}{(2\pi\sigma_w^2)^{L/2}} \exp \left\{ \frac{-1}{2\sigma_w^2} (y-Hx)^T (y-Hx) \right\}$$

$$\text{prior term: } f(x) = \frac{1}{(2\pi)^{L/2} |\Sigma_x|^{1/2}} \exp \left\{ -\frac{1}{2} (x-\mu_x)^T \Sigma_x^{-1} (x-\mu_x) \right\}$$

$$\hat{x}_{\text{maximum A-Posteriori}} = \arg\max \log f(y|x) f(x)$$

$$\begin{aligned} \text{Let } \hat{J}(x) &= \log[f(y|x) f(x)] \\ &= \frac{-L}{2} \log(2\pi\sigma_w^2) - \frac{1}{2\sigma_w^2} (y-Hx)^T (y-Hx) - \frac{L}{2} \log(2\pi) \\ &\quad - \frac{1}{2} \log |\Sigma_x| - \frac{1}{2} (x-\mu_x)^T \Sigma_x^{-1} (x-\mu_x) \end{aligned}$$

we want to minimize  $\hat{J}(x)$  term. So we'll get derivative and equals it to zero.

$$\frac{\partial \hat{J}(x)}{\partial x} = 0$$

$$\frac{1}{\sigma_w^2} H^T (y-Hx) - \Sigma_x^{-1} (x-\mu_x) = 0$$

$$\left( \frac{1}{\sigma_w^2} H^T H + \Sigma_x^{-1} \right) x = \frac{1}{\sigma_w^2} H^T y + \Sigma_x^{-1} \mu_x$$

$$\hat{x}_{\text{maximum A-Posteriori}} = (H^T H + \sigma_w^2 \Sigma_x^{-1})^{-1} (H^T y + \sigma_w^2 \Sigma_x^{-1} \mu_x)$$

$$\begin{aligned} \mu_w &= 0 \\ \mu_x &= 0 \\ \sigma_w^2 &= 25 \times 10^{-4} \\ \Sigma_x &= (\lambda L^T L)^{-1} \end{aligned}$$

$$\hat{x}_{\text{maximum A-Posteriori}} = [H^T H + 25 \times 10^{-4} \cdot (\lambda L^T L)]^{-1} [H^T y + 25 \times 10^{-4} \cdot (\lambda L^T L) \cdot 0]$$

$$\hat{x}_{\text{maximum A-Posteriori}} = [H^T H + 25 \times 10^{-4} \cdot (\lambda L^T L)]^{-1} [H^T y]$$

c) Derive the minimum mean square error (MMSE) Linear estimator for  $x$ .

Ali Ihsan GILLI  
161024033  
Agha

For Gaussian case, the Linear MMSE estimator is the same as MMSE estimator. So, I'll calculate the MMSE estimator, because it is more easy for me and I'll find the same result with Linear MMSE (orthogonal principle theorem).

$$\hat{x}_{\text{MMSE}} = E\{x|y=y\} \text{ (expected value of } x \text{ given } Y=y)$$

$$\text{Bayesian rule: } f(x|y) = \frac{f(y|x)f(x)}{\int_{-\infty}^{+\infty} f(y|x')f(x')dx'} = \frac{\text{likelihood } x \text{ prior}}{\text{normalization term.}}$$

likelihood (we know observation is Gaussian)

$$f(y|x) = \frac{1}{(\sqrt{2\pi}\sqrt{\sigma_w^2})^{1/2}} \exp\left\{-\frac{1}{2\sigma_w^2} (y-Hx)^T (y-Hx)\right\}$$

prior

$$f(x) = \frac{1}{(2\pi)^{\frac{L}{2}} \cdot |\Sigma_x|^{1/2}} \exp\left\{-\frac{1}{2} (x-\mu_x)^T \Sigma_x^{-1} (x-\mu_x)\right\}$$

we'll calculate the  $f(x|y)$  posterior.

$f(x)$ : Gaussian,  $f(y|x)$  Gaussian: and  $w$  and  $x$  are independent.

Joint pdf of  $x, w$ :

$$\begin{bmatrix} x \\ w \end{bmatrix} \sim \mathcal{N}\left(\begin{bmatrix} \mu_x \\ 0 \end{bmatrix}, \begin{bmatrix} \Sigma_x & 0 \\ 0 & \sigma_w^2 I \end{bmatrix}\right)$$

$\mu_x$ : mean of  $x$ .  
 $\mu_w$ : mean of  $w$ .  
 $\Sigma_x$ : covariance matrix of  $x$ ,  
 and crosses terms are zero  
 because of  $w$  and  $x$  are independent.

Joint pdf of  $y, x$ :

$$\begin{bmatrix} y \\ x \end{bmatrix} \sim \mathcal{N}(d, e) \text{ , } d: \text{mean, } e: \text{variance.}$$

$$d = \begin{bmatrix} H & I \\ I & 0 \end{bmatrix} \begin{bmatrix} \mu_x \\ 0 \end{bmatrix} = \begin{bmatrix} H\mu_x \\ \mu_x \end{bmatrix}$$

$$e = \begin{bmatrix} H & I \\ I & 0 \end{bmatrix} \begin{bmatrix} \Sigma_x & 0 \\ 0 & \sigma_w^2 I \end{bmatrix} \begin{bmatrix} H^T & I \\ I & 0 \end{bmatrix} = \begin{bmatrix} H^T & I \\ I & 0 \end{bmatrix} \begin{bmatrix} \Sigma_x H^T & \Sigma_x \\ \sigma_w^2 I & 0 \end{bmatrix} = \begin{bmatrix} H\Sigma_x H^T + \sigma_w^2 I & H\Sigma_x \\ \Sigma_x H^T & \Sigma_x \end{bmatrix}$$

$$\begin{bmatrix} y \\ x \end{bmatrix} \sim \mathcal{N}\left(\begin{bmatrix} H\mu_x \\ \mu_x \end{bmatrix}, \begin{bmatrix} H\Sigma_x H^T + \sigma_w^2 I & H\Sigma_x \\ \Sigma_x H^T & \Sigma_x \end{bmatrix}\right)$$

conditional pdf:

$$x|y=y \sim \mathcal{N}\left(\underbrace{\Sigma_x H^T (H\Sigma_x H^T + \sigma_w^2 I)^{-1} (y - H\mu_x) + \mu_x}_{\text{mean}}, \underbrace{\Sigma_x - \Sigma_x H^T (H\Sigma_x H^T + \sigma_w^2 I)^{-1} (H\Sigma_x)}_{\text{variance.}}\right)$$

$$\hat{x}_{\text{Linear MMSE}} = \hat{x}_{\text{MMSE}} = \Sigma_x H^T (H\Sigma_x H^T + \sigma_w^2 I)^{-1} (y - H\mu_x) + \mu_x$$

③

9) Calculate the peak signal-to-noise ratio PSNR of each estimate such that

$$PSNR = 20 \log_{10} \left( \frac{\max(x) \sqrt{255^2}}{\|x - \hat{x}\|} \right)$$

Ali insan Güllü  
16074013

Adnan

	ML	MAP ( $\lambda = 100$ )	NMSE ( $\lambda = 1000$ )
PSNR (dB)	-31,252 dB	-9,584 dB	-11,1809 dB
